

# Velociraptor

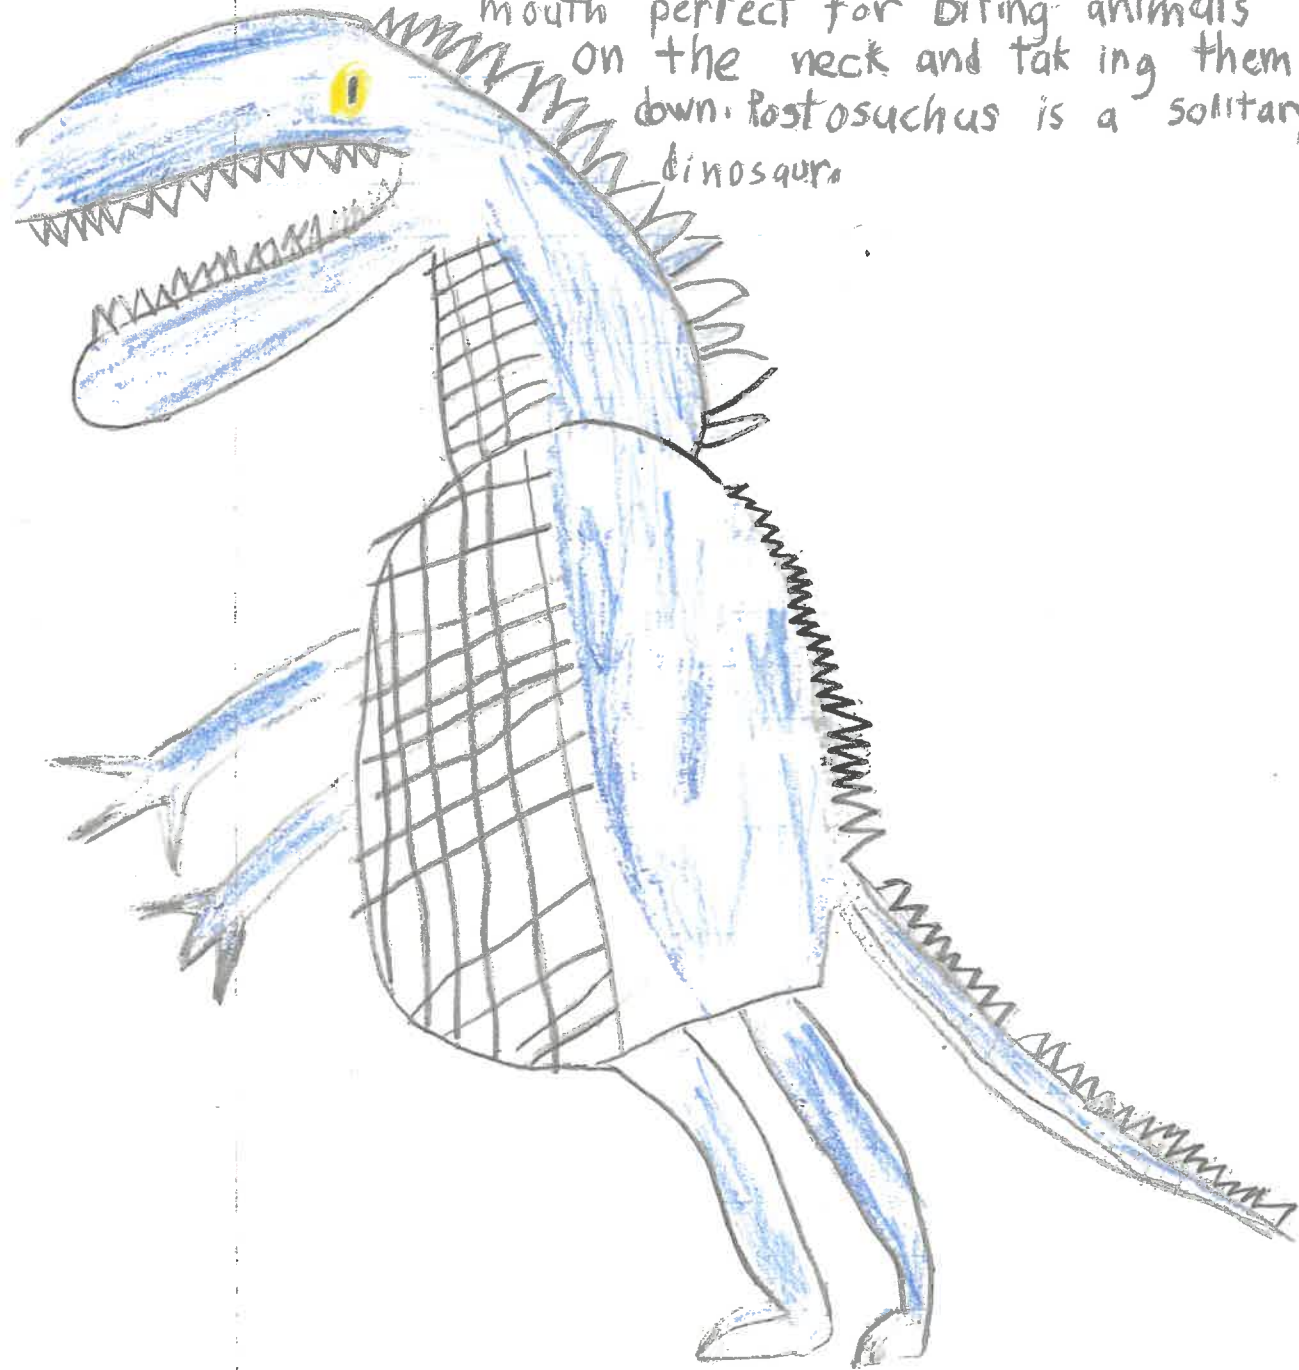

A velociraptor is 6 feet long. It lived 75 million years ago.

Velociraptors usually hunt in packs unless it got separated from its pack it's called a loner. The diet of a velociraptor is mainly big dinosaurs but if it's a loner it's mainly small animals or big dinosaurs. It runs to circle its prey and then bites its prey in the neck and starts eating its meals.

# Postosuchus

Postosuchus is up to 15 feet long. It lived 228 million years ago. It was a powerful dinosaur that would take down anything it could. Its mouth was designed like a alligator mouth perfect for biting animals on the neck and taking them down. Postosuchus is a solitary dinosaur.

# Isanosaurus

A Isanosaurus lived 214 million years ago. It's 20 feet long and eats plants. These animals live in herds. But if you separate one from its herd it's vulnerable.

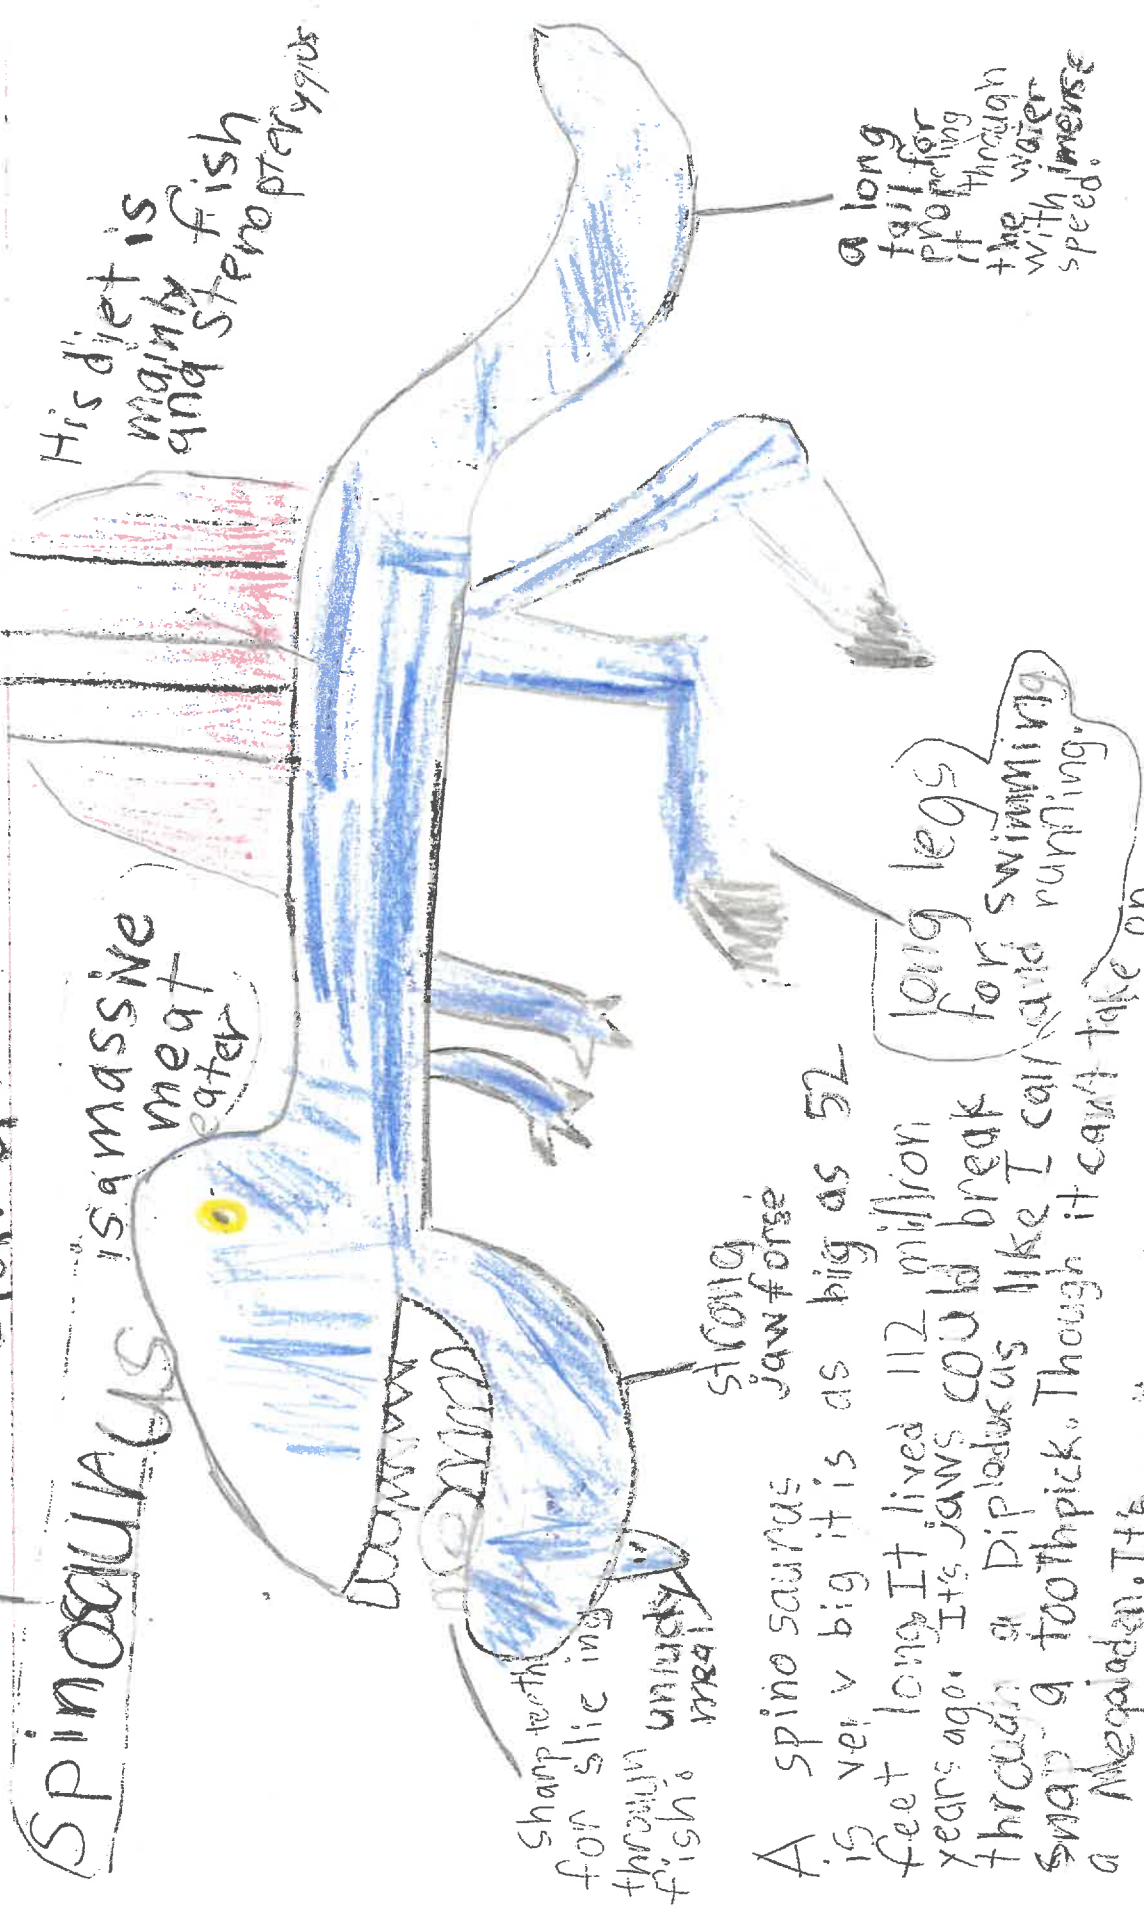

# Scelidosaurus

A Scelidosaurus lived 146 million years ago. It's 13 feet long and eats plants. It's covered in armor and spines are all over it. They live in herds. They are not powerful alone.

# SPINOSAURUS

SPINOSAURUS is a massive meat eater

His diet is mainly fish and Stegosaurs

Sharp teeth for slicing through fish's unucky meat

strong jaw force

A spino saurus is very big it is as big as 52

feet long. It lived 112 million years ago. Its jaws could break through a Diplocaeras like I can and snap a toothpick. Though it can't take on a Megalodon. Its mouth is designed to eat fish like a crocodile.

long legs for swimming and running.

a long tail for propelling it through the water with immense speed.
